

# JUNSEN LI

Objective: Quantitative Research / Risk & Data Analytics (Internship)

+86 189-7606-5269 | 251275042@smail.nju.edu.cn | WeChat: junsenli18976065269

Nanjing University · School of Engineering Management · CS-Finance Experimental Class (Sophomore)

GitHub: github.com/jason218-ljs

## EDUCATION

**Nanjing University — School of Engineering Management, Computer Science & Finance Experimental Class**

Sep 2025 – Jun 2029 (exp.)

- GPA **4.28 / 5.0**; CET-4: 579 (CET-6 scheduled Dec 2026)
- Interdisciplinary CS × Finance program. Core courses: Corporate Finance, Financial Economics, Money & Banking, Probability & Statistics, Python Data Mining

## INTERNSHIP EXPERIENCE

**Transwarp Technology — R&D Center / AI Product Department, Quantitative Researcher**

Intern · Jul – Aug 2026

AI-native portfolio investment program · Member of a 5-person Investment Committee with risk veto; owned factor scoring, portfolio construction, backtest validation, and risk checks

- **Led development of AlphaForge**, a multi-factor stock-screening and backtesting system: designed a 100-point three-layer scoring framework (fundamental / technical / money-flow) with adaptive thresholds across 21 sub-industries, a two-stage “pattern pre-filter + quality scoring” selection logic, 214 automated tests, and a web dashboard
- **Built an event-driven backtesting engine** modeling A-share market frictions (T+1, price limits, stamp duty, slippage) and Kelly-criterion position sizing with per-stock and per-industry risk constraints; multi-factor strategies achieved positive excess returns over the market benchmark on real A-share data
- **Led design of a three-flywheel self-evolution system** (engineering / data / cognition): zero-intrusion sidecar architecture for pipeline health checks, data-quality detection, and methodology reviews; 62 unit tests, CI, and AST-based static rule checks
- **Contributed to Buffett-Value-Agent**, a value-investing AI agent: implemented rule-based financial computation and risk-validation modules under a Human-AI Boundary Protocol (HABP)

## PATENT (PENDING)

**“Method and System for Trustworthy Uncertainty Constraint of AI Agents” — Invention Patent**

3rd Inventor · Filed 2026

- Trustworthy-control technology for LLM-based agents, constraining behavioral, semantic, and provenance uncertainty in multi-step execution

## PROJECTS

**China Undergraduate Mathematical Contest in Modeling (CUMCM) — Programmer**

2026 – Present

- Built an optical-efficiency simulator for a heliostat-field problem: implemented cosine, shadowing, atmospheric-transmission, and truncation models, with KD-tree neighbor search and NumPy vectorization for efficient full-field simulation

**“AI + Engineering Management” Course Project: Data Analytics Assistant for Enterprise Management — Core Developer**

Sep 2026 – Present

- 7-member team project (in progress) on social-insurance & individual-income-tax compliance analytics; responsible for technical design and the data-processing / rule-engine modules

## SKILLS

- **Quant methods:** multi-factor stock scoring & screening, event-driven backtesting, Kelly position sizing, risk & performance attribution
- **Programming:** Python (pandas / NumPy / matplotlib), pytest, Git; Excel / Word / PowerPoint / Markdown
- **Languages:** Mandarin (native), English (CET-4 579; CET-6 Dec 2026)
